

Public Presentation on the Findings of the Environmental Impact Assessment for the Proposed Residential Development at Coral Springs, Trelawny

**Presented by
Environmental Solutions Limited
On behalf of
Gore Developments Limited**

**September 18, 2012 at the Kettering Baptist Church, Duncans -
Trelawny**

Presentation Outline

❖ Description of the Project

- ◆ Location
- ◆ Design of the Development
- ◆ Amenities

❖ The EIA Process

- ◆ Purpose of the EIA
- ◆ Methodology
- ◆ TORs
- ◆ Role of the Consultants
- ◆ The EIA Team
- ◆ Work Plan

❖ The Existing Environment

- ◆ Physical
- ◆ Biological
- ◆ Socio-economic

❖ Potential Environmental Impacts

- ◆ Air quality
- ◆ Noise
- ◆ Slopes
- ◆ Water resources
 - Hydrology, drainage and run-off
 - Sewage
- ◆ Geology
- ◆ Ecology
- ◆ Socio-economic
- ◆ Hazardous materials
- ◆ Solid waste

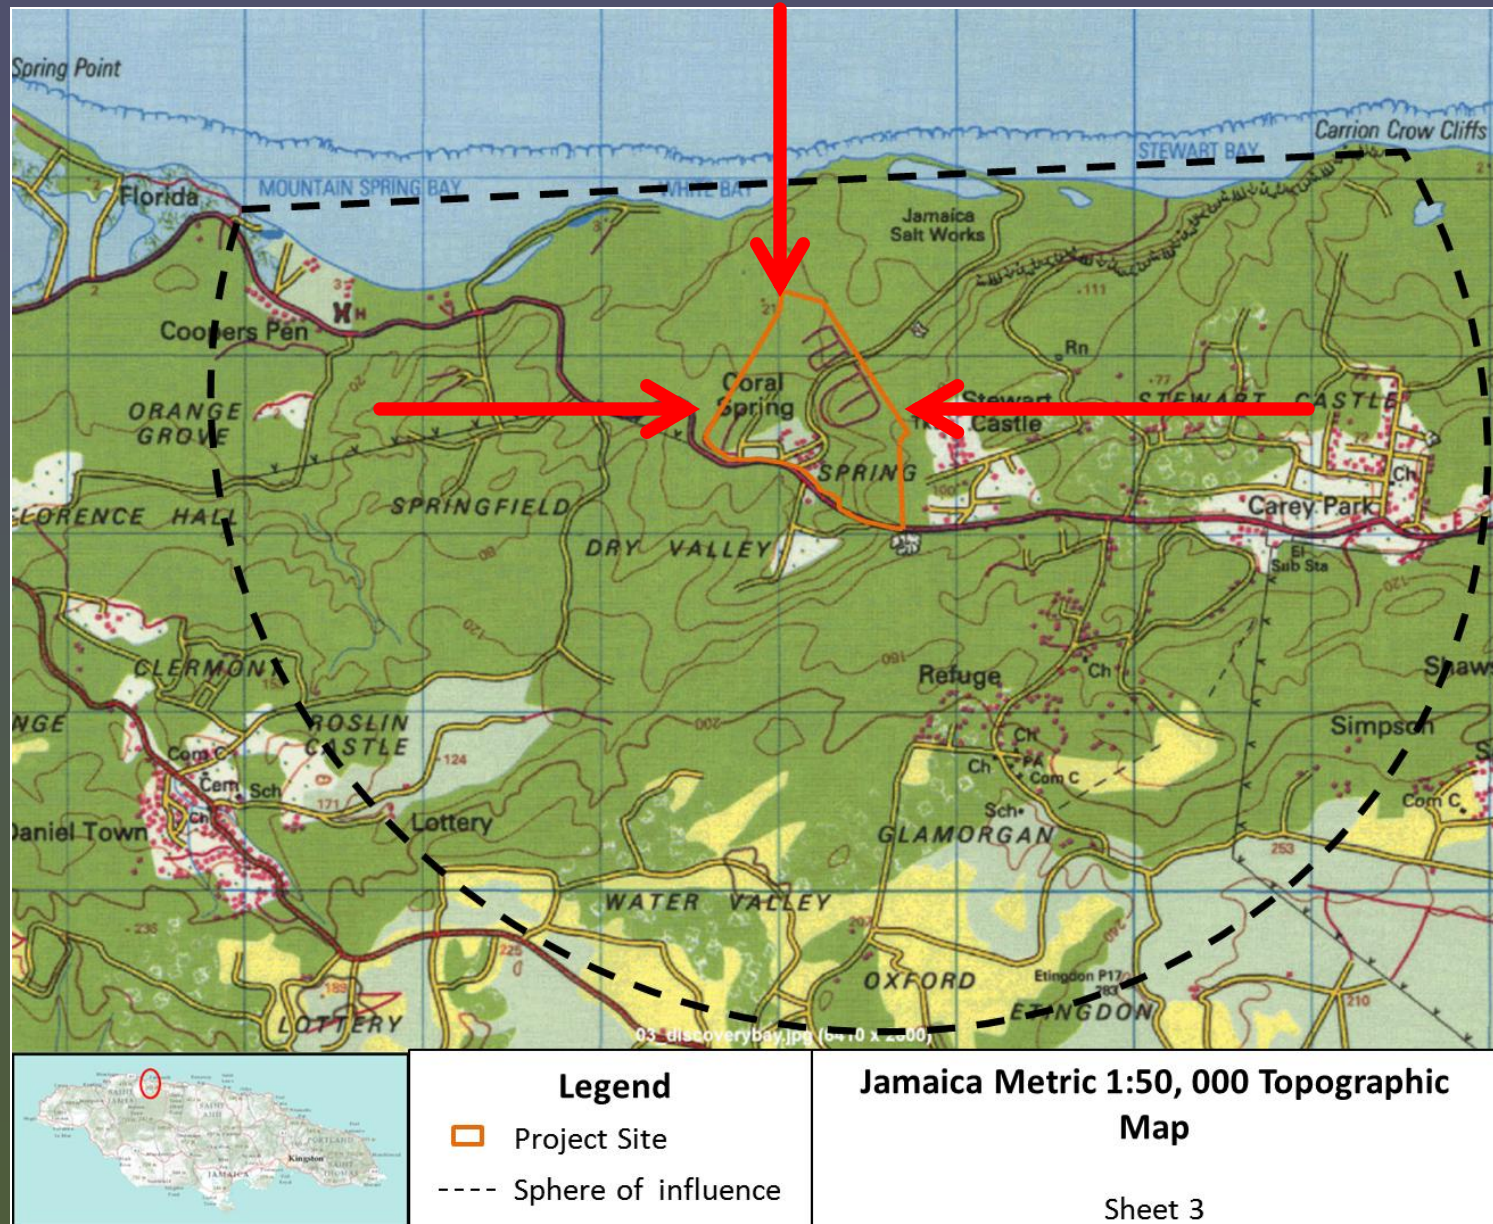

❖ Mitigation Measures

- ◆ Construction phase
- ◆ Operation phase

❖ Cumulative Impacts

❖ Consideration of Alternatives

Project Site Location

Satellite Imagery of Site

Coral Spring-Mountain Spring

Coral Springs

- ❖ Was initially subdivided in the 1970s for 380 lots
- ❖ 39 Titled lots
- ❖ 26 houses built in southern flat area

0 300 600ft

© 2010 DigitalGlobe, Image courtesy of Google Earth, © 2010 GeoEye, © 2011 Microsoft Corp.

Proposed Development Layout

- 169 acres (68 Ha) of land
- 401 two-bedroom houses with lot size of 420.5 m²
- Total of 503 lots
- 102 larger service lots

Typical GDL House

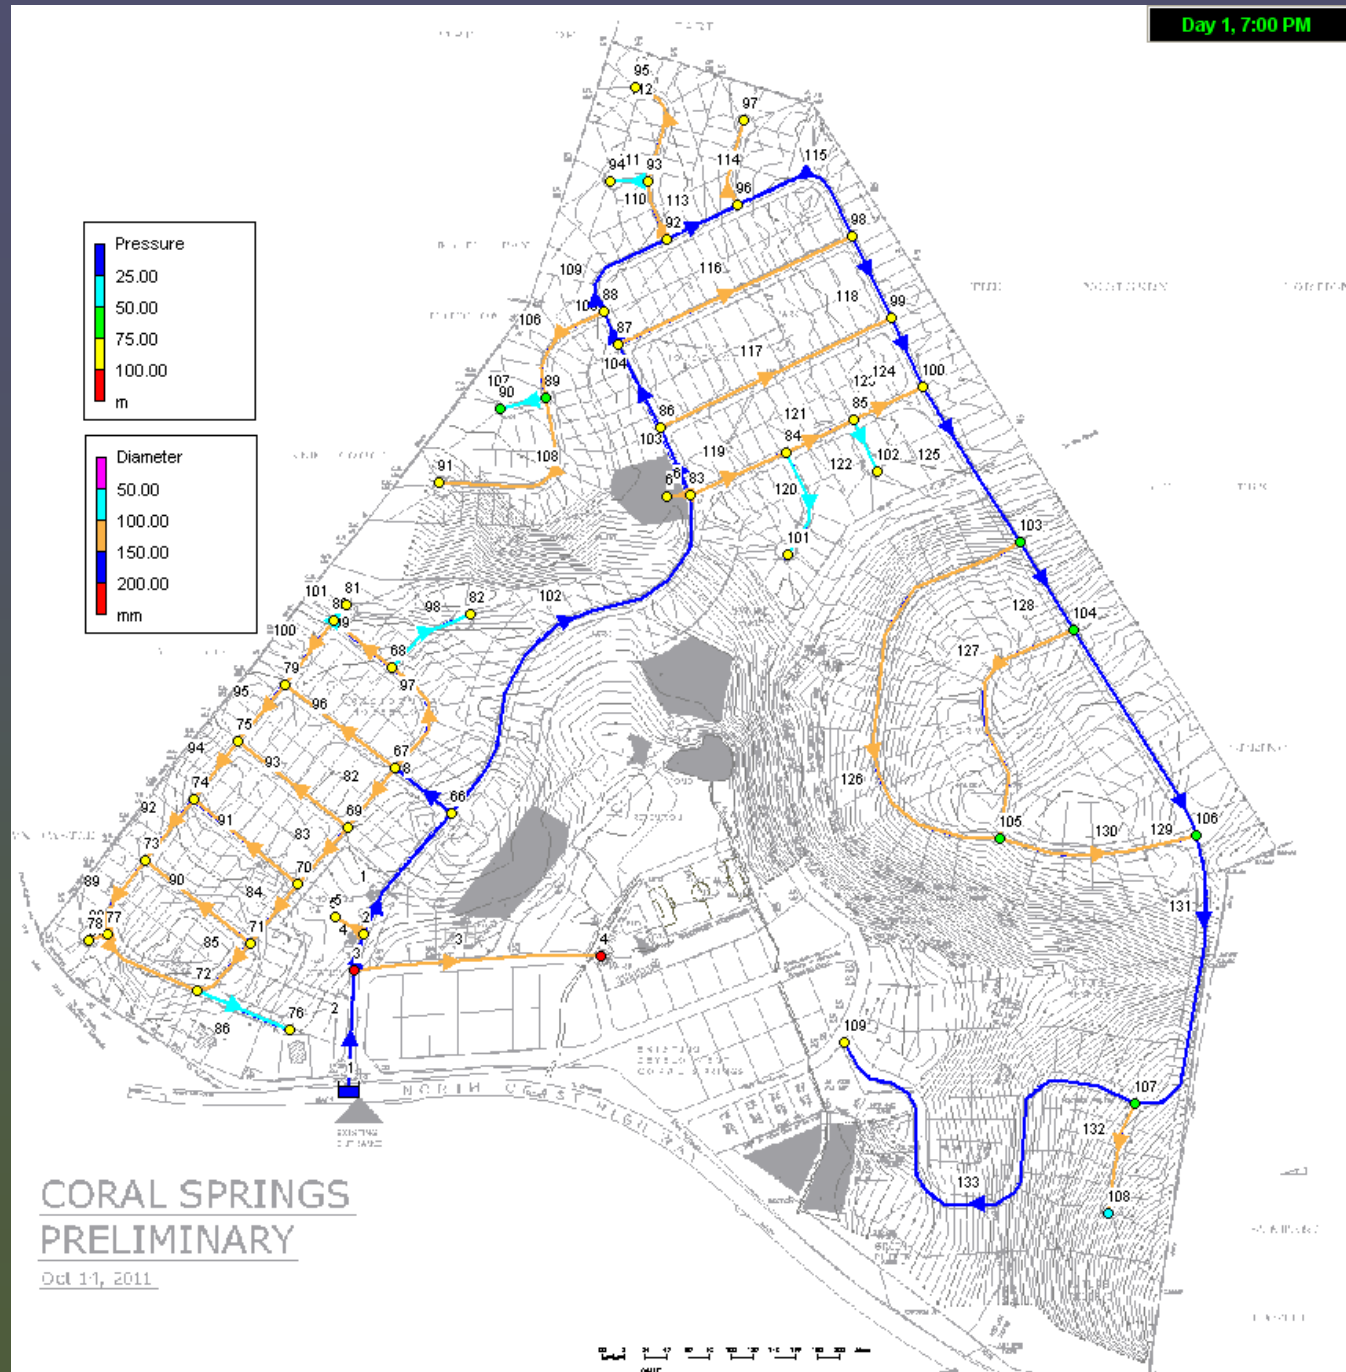

Amenities

- Green spaces (17.6 Ha)
- Electricity
- Water supply
- Sewage treatment
- Drainage
- Commercial area including Gas Station
- Basic School allocation

Water Supply

Day 1, 7:00 PM

The EIA Process

Purpose

- Describe project area and environmental conditions, identify potential impacts & determine mitigation measures

Data

- Make use of available data where appropriate and collate new data as necessary

Reporting

- Conduct assessment and prepare report
- Conduct public hearing for citizens' response

Methodology

Multi-disciplinary team used charette style method for data gathering, analysis and presentation

Data gathering:

- Review of reports and background documents
- Field studies
- Intrusive tests
- Analysis of maps, plans, aerial photos
- Structured interviews
- Laboratory analyses

Team meetings:

Iterative interaction with developer, architects and engineers

Terms of Reference

Approved
by NEPA
(June 19,
2012)

- Internationally accepted TOR components for Human Habitation Projects
- Developed between NEPA, ESL and GDL
- Included in EIA final report for reference

Role of the Consultants

Collect and analyze all relevant data, information and viewpoints

Systematically identify and examine possible consequences of proposed development, and potential impacts on the environment

Determine appropriate means to avoid or reduce (mitigate) impacts to acceptable levels

Utilize objectivity and professional integrity in analyzing and reporting all findings

Serve as a liaison between developer and regulatory agency

The consultants do not serve as proponents of the project

The EIA Professional Team

Barry Wade, PhD - Team Leader; Environmental Scientist

George Campbell, MSc – Economist

Kimberly Bryan, MSc – Environmental Scientist

Marlon Beale, PhD Candidate – Avifaunal Specialist

Simone Lee, MSc – Terrestrial Ecologist

Roderick Ebanks, MPhil - Archaeologist

GDL Specialist Consultants

Architects

Portico Ltd

Civil and
Structural
Engineers

FCS
Consultants
Ltd

Hydrologist

Brian
Richardson

Geotechnical
Engineers

NHL
Engineers
Ltd

Surveyors

Masters and
Johnson

Work Plan November 2011 to September 2012

- ❖ Client meetings
- ❖ Review of documents
- ❖ Review of legislation
- ❖ Site investigations
- ❖ Community surveys
- ❖ Water and Air analyses
- ❖ Vegetation surveys
- ❖ Faunal surveys
- ❖ Hydrological/flood evaluation study

- ❖ Data review and analysis
- ❖ Analysis of impacts
- ❖ Draft report
- ❖ Client review
- ❖ Final report to NEPA
- ❖ Public notices
- ❖ Public presentation of findings

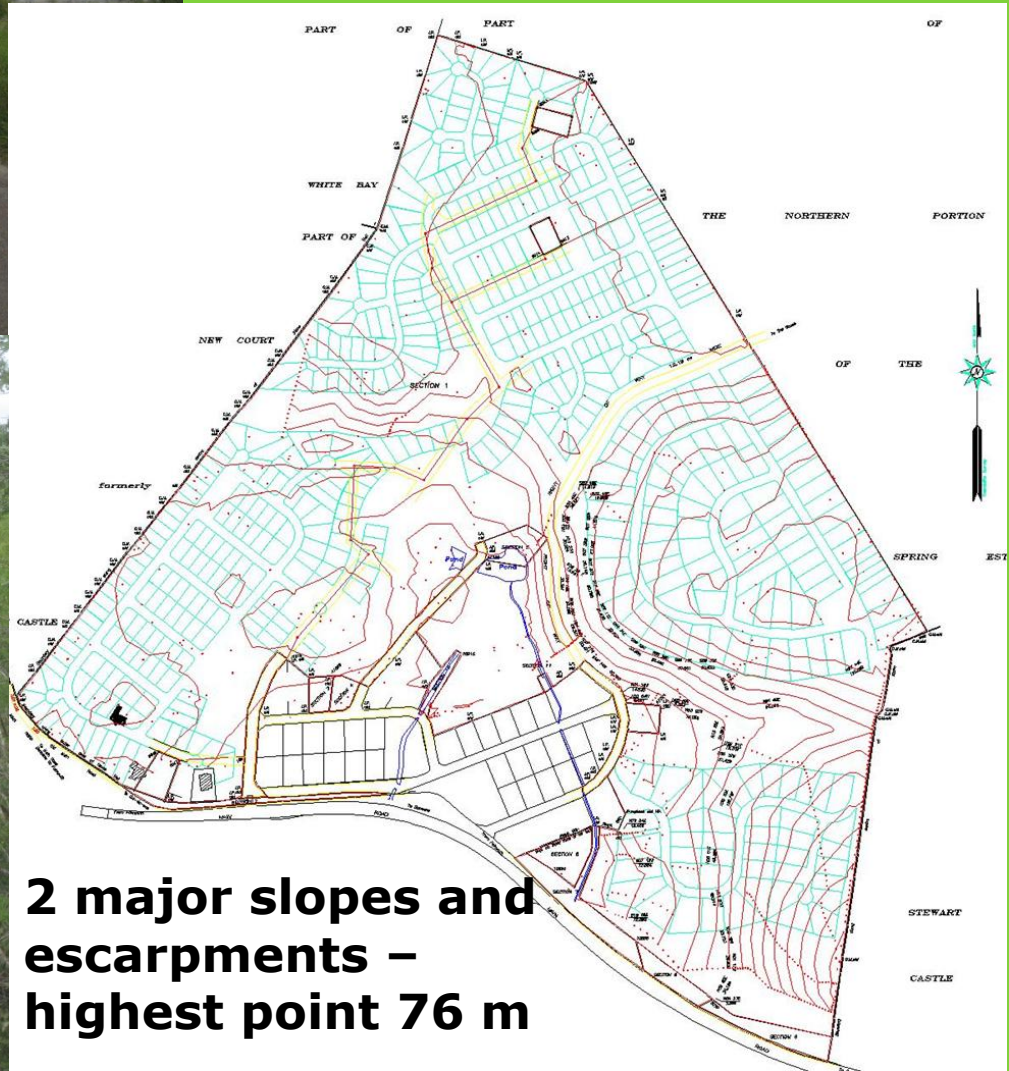

The Existing Environment

A photograph of a forest stream. The water is brown and murky, reflecting the surrounding green foliage and trees. Several fallen branches and logs are scattered across the stream and its banks. The banks are covered with dry leaves, twigs, and some green plants. The overall scene is a natural, somewhat overgrown forest environment.

Physical Environment

Topography

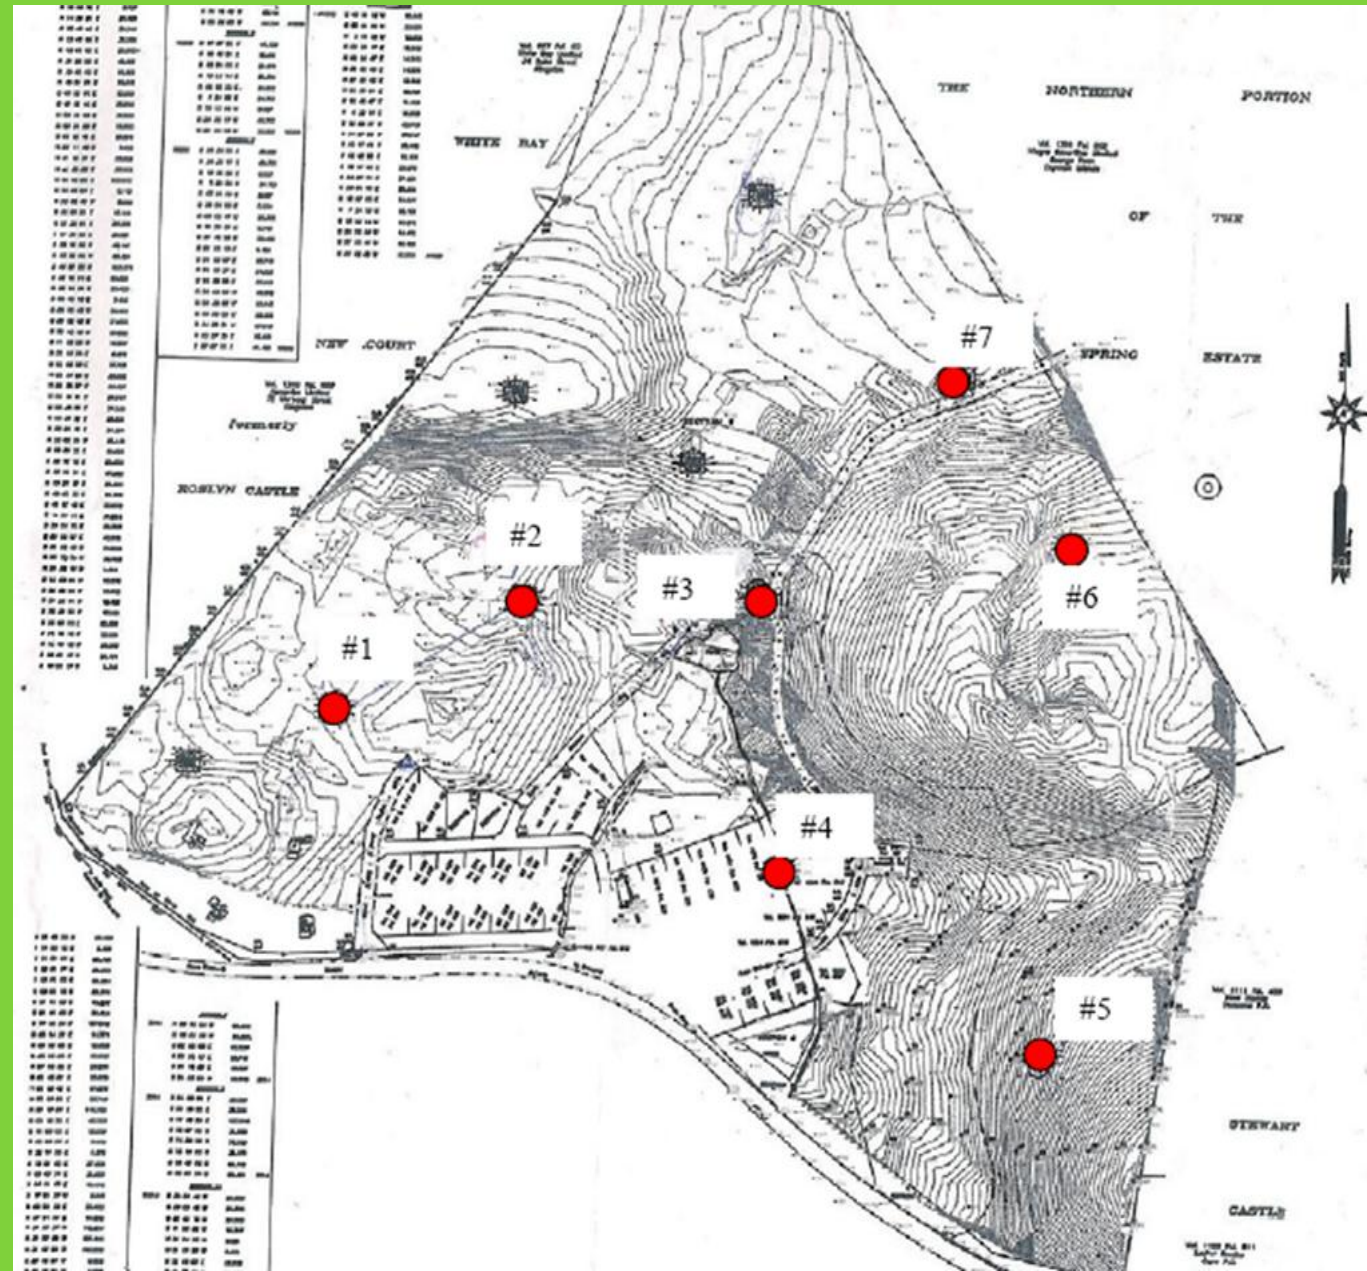

More than 50% of site is low lying – lowest point 7 m

**2 major slopes and
escarpments –
highest point 76 m**

Soils

- 6 of 7 boreholes dug
- BH #6 was abandoned
- Soil profiles were created

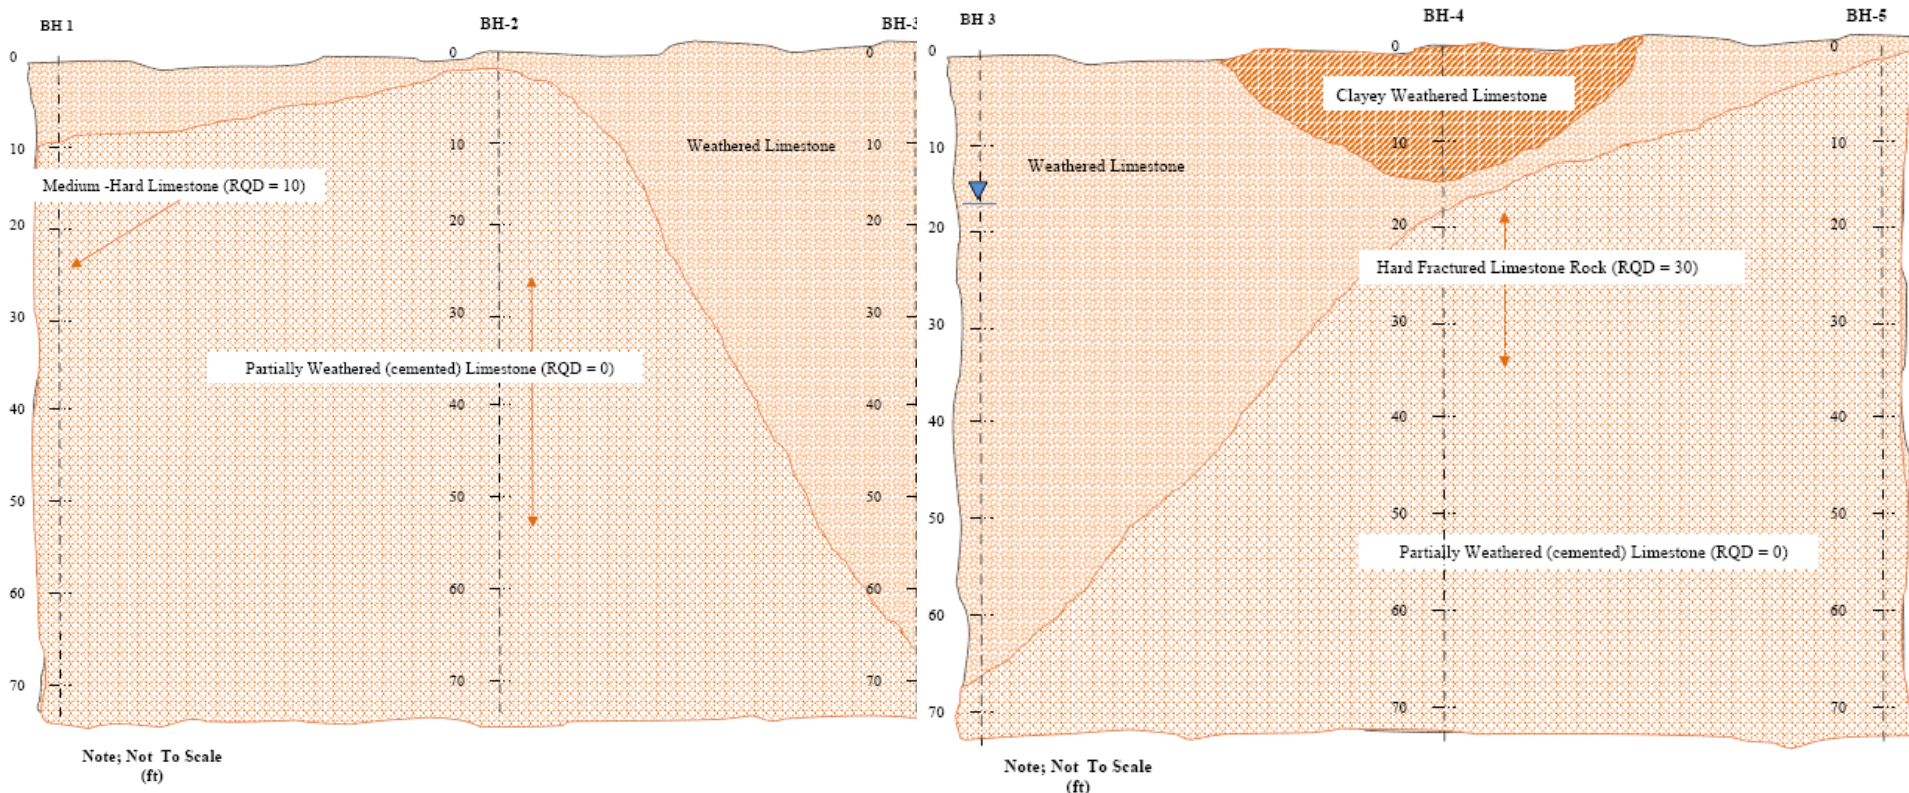

Soil Profiles

18 samples
were tested -
average
Compressive
Strength of
1640 psi

Compact to v.
dense Gravelly
Sands
(weathered
limestone) +
Clays

Geology

- **Mm – Montpelier Limestone Formation**
- **Solid red lines show geological faults**
- **Rocks classified as Medium hard limestone**

Hydrology and Drainage

Site drainage controlled by central sinkhole/pond

Sinkhole lip is clearly demarked at the 15 m (50 ft.) contour

All drainage lines discharge into the sinkhole

Centre

Drainage Basin and Sinkhole

Northern end

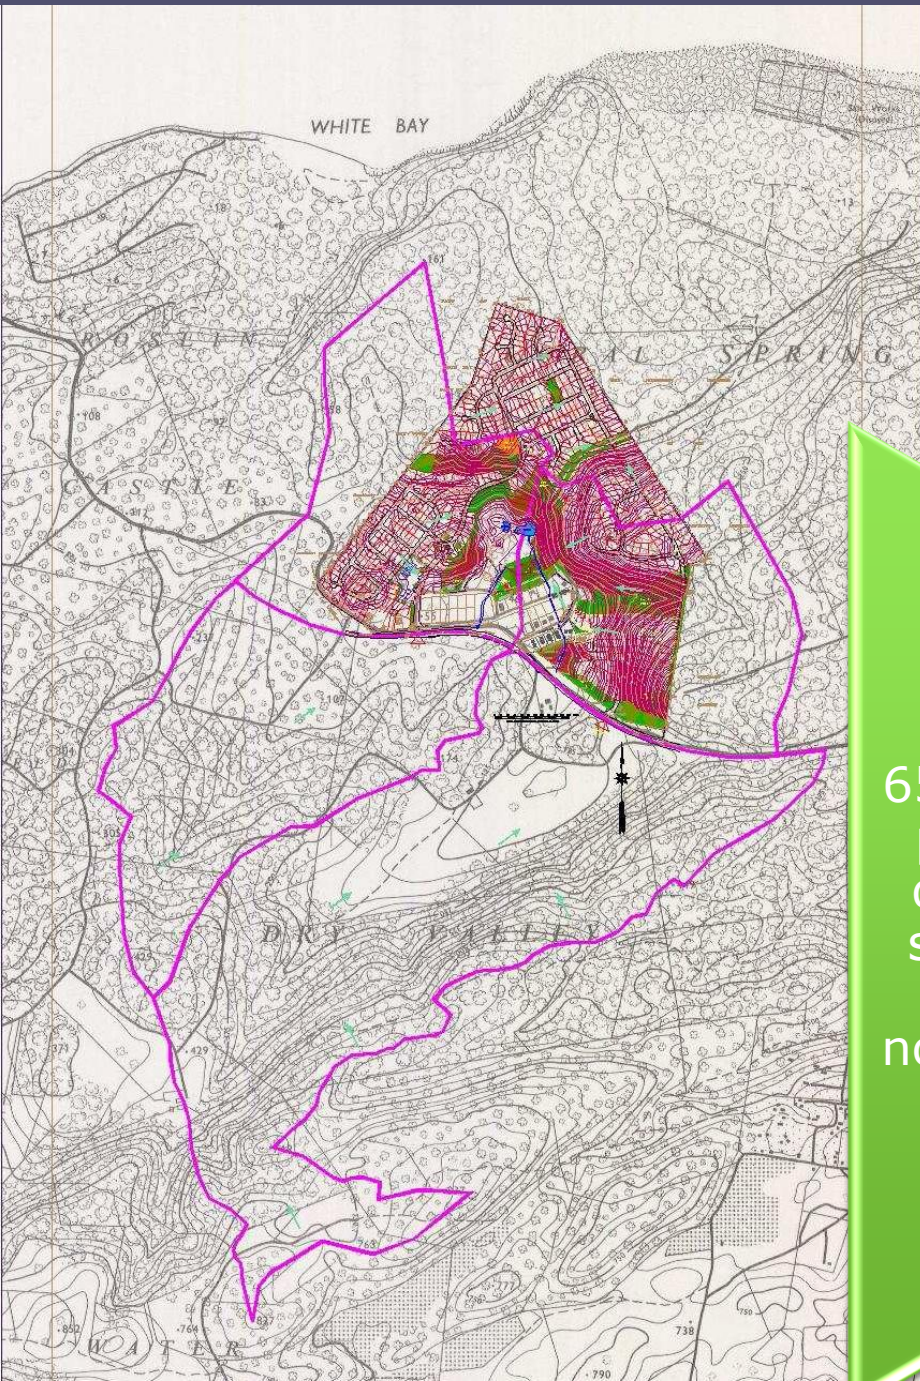

Eastern section

**Overflow of the high water
mark**

Natural Drainage Features

Sinkhole drains an area of approximately 315 hectares

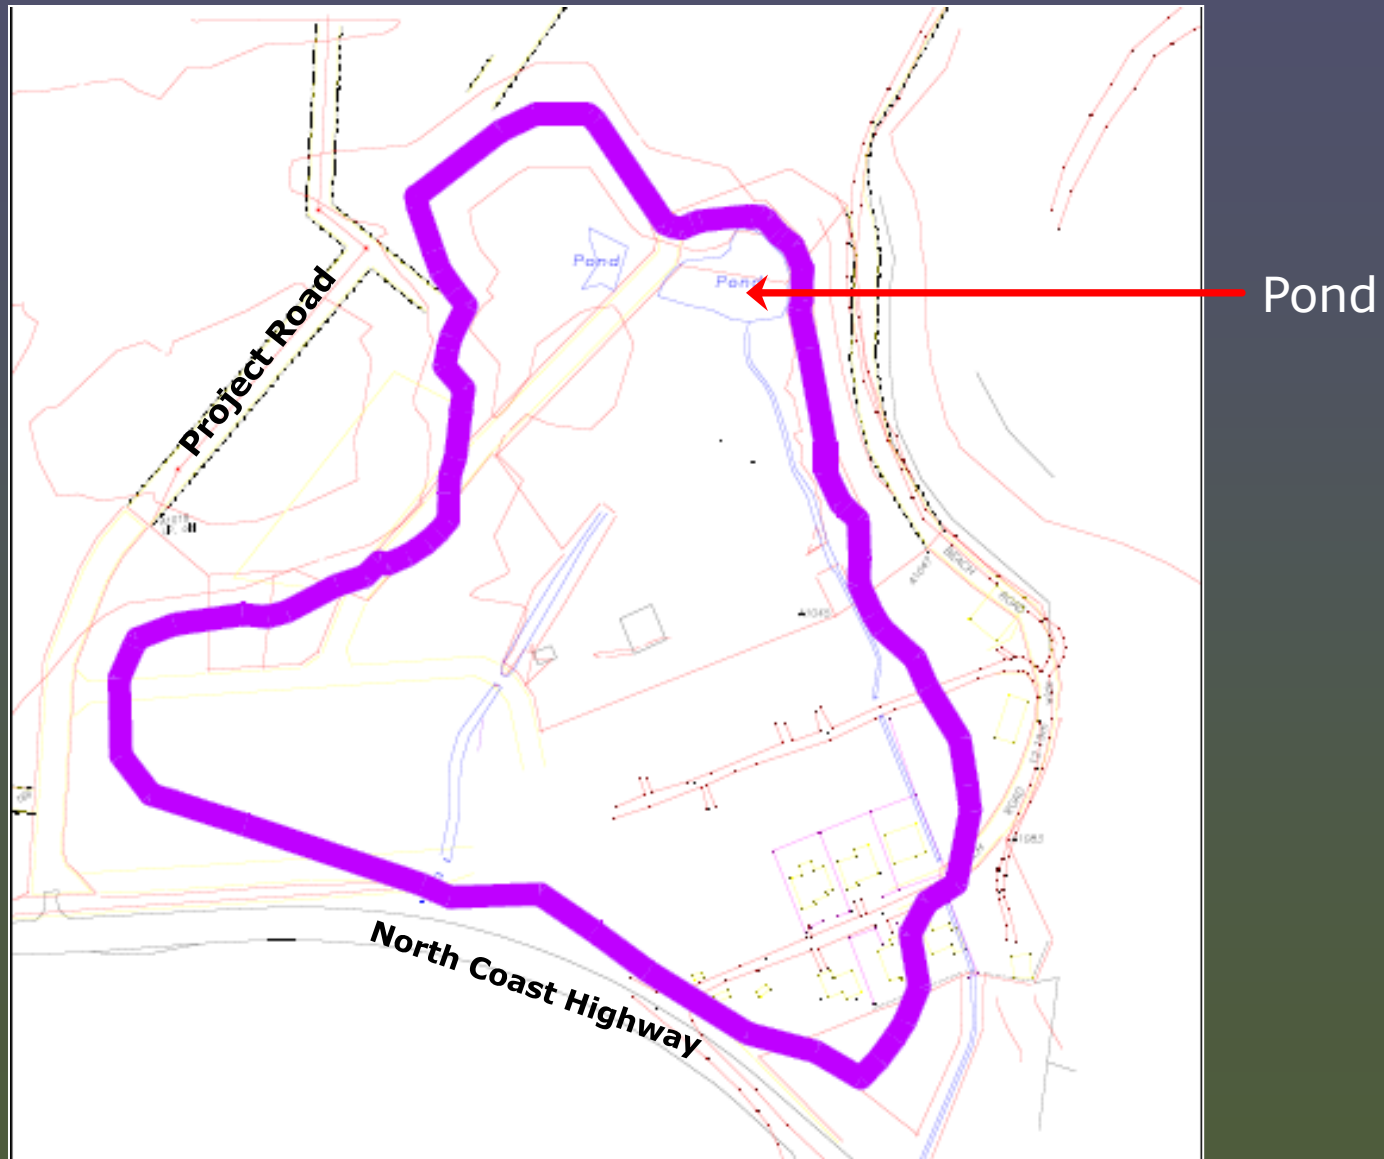

65% of the property drains to sinkhole; 35% northwards

North Coast Highway separates the southern catchment (the Dry Valley side) from the Coral Springs sinkhole

Flows from south are channeled via a culvert beneath the highway to the sinkhole

100 Year Flood Plain (17.48 m)

Water Quality

Drain leading
to sinkhole
monitored
from southern
Dry Valley
property

High BOD and
iron values in
the drain after
passing existing
houses

Sinkhole/pond
acts as a sink
for
contaminants

Natural Hazards

Flooding

- Known to occur at the lowest elevations on site

Hurricanes

- Like rest of Jamaica the site is prone to hurricane impacts and climate variability

Landslides

- No historical evidence of landslides

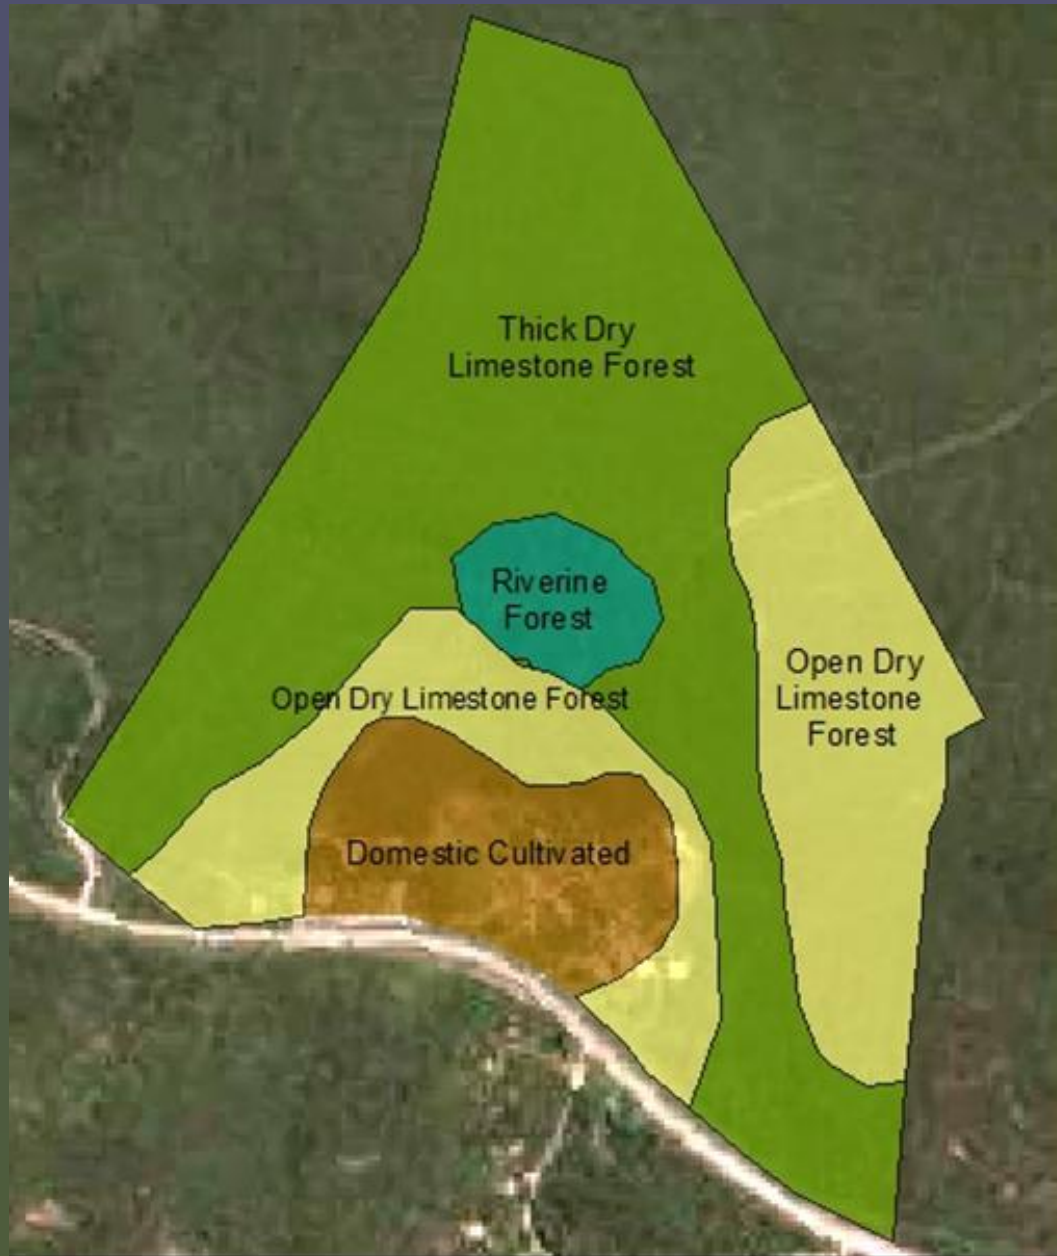

Earthquakes

- Fault line traverses site
- Jamaica located in active zone

Pollution

- No known incidences of pollution in a 5 Km zone

Biological Environment

Legend

Coral Springs Land Use

- Domestic Cultivated
- Open Dry Limestone Forest
- Riverine Forest
- Thick Dry Limestone Forest

0 0.125 0.25 0.5 Kilometers

Google Earth Image (2009) overlain with latest Sub-Division Map for Coral Springs (2012)

Map created by Environmental Solutions Ltd. February 2012.
Datum: JAD 2001

Domestic Cultivated Zone

Bougainvillea

Mango

Papaya

Ackee

Orange

Closed/Thick Dry Limestone Forests

Dense shrub and herb species in lower half of the forest:

**Red
Birch**

Burnwood

Bullhoof

Guango

Logwood

Open Dry Limestone Forests

**Less dense upper canopy
and more lower scattered
shrub presence:**

- Red Birch
- Burnwood
- Bullhoof
- Guango
- Logwood

Riverine Vegetation

Bamboo

Sweetsop

Breadfruit

Birds

38 bird
species

13 endemics (e.g.
Jamaican Tody, White
Chinned Thrush, and
Jamaican Lizard Cuckoo)

3 endemic sub-species

12 resident species

8 (winter) migrant species
(e.g. Osprey, American
Redstart and Black
Throated Blue Warbler)

Other Fauna

14 butterfly species (two endemics)

“Croaking lizard”

Bats

Termites

Lampyrid Fireflies

Jamaican Slider Turtle (observed in pond)

Socio-Economic Environment

- ◆ Tourism Developments

- ◆ Heritage Attractions

- ◆ Falmouth Deep Water Terminal

- ◆ Housing Developments

- ◆ Florence Hall and Stone brook

The Communities of Interest are:

Falmouth: Parish capital and main commercial centre; population 8,188

- Coral Springs – existing residential estate
- Duncans
- Stewart Castle
- Carey Park and Refuge
- Retreat Heights

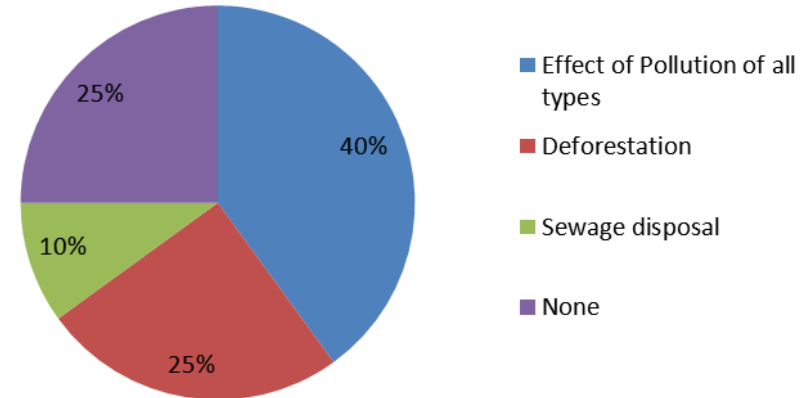

Community Opinion on Project

Approval rating for the project

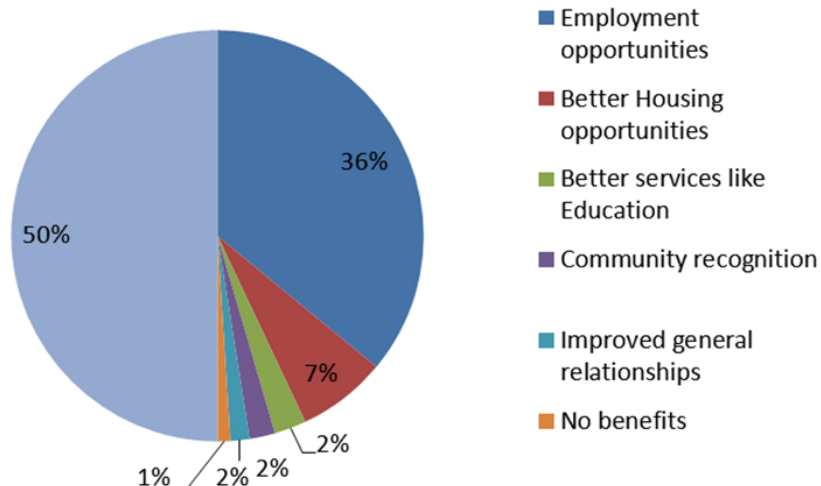

■ Highly approved ■ Approved ■ Not highly approved ■ Unapproved

Environmental fears of the project?

Benefits of the project?

General concerns about the project?

Social Infrastructure

Mainly centred in Falmouth

Utilities:
Water
Electricity
Telecommunications

**Public
Health
Facilities**

Education:
William Knibb
and Holland
High

**Waste
Management**

**Fire
Brigade**

Transportation

Heritage

Possible storm
water structure
leading into the
sinkhole/pond

Pack stone wall
around the
north western
section of pond

Very few visible
remnants
above ground

Heritage

**Concrete square
wall structure:
cattle watering
facility?**

**Eastern (left) and
western (right)
pack stone
boundary walls**

Potential Environmental Impacts

Occurrence of impacts:

- **Construction Phase (Site Preparation and Construction)**
- **Operations**

Classification of Impacts:

- **Positive or negative**
- **Direct or indirect**
- **Short or long term**
- **Reversible or irreversible**
- **Cumulative**

Potential Impacts

Air quality:

- Increased dust during construction activities

Noise:

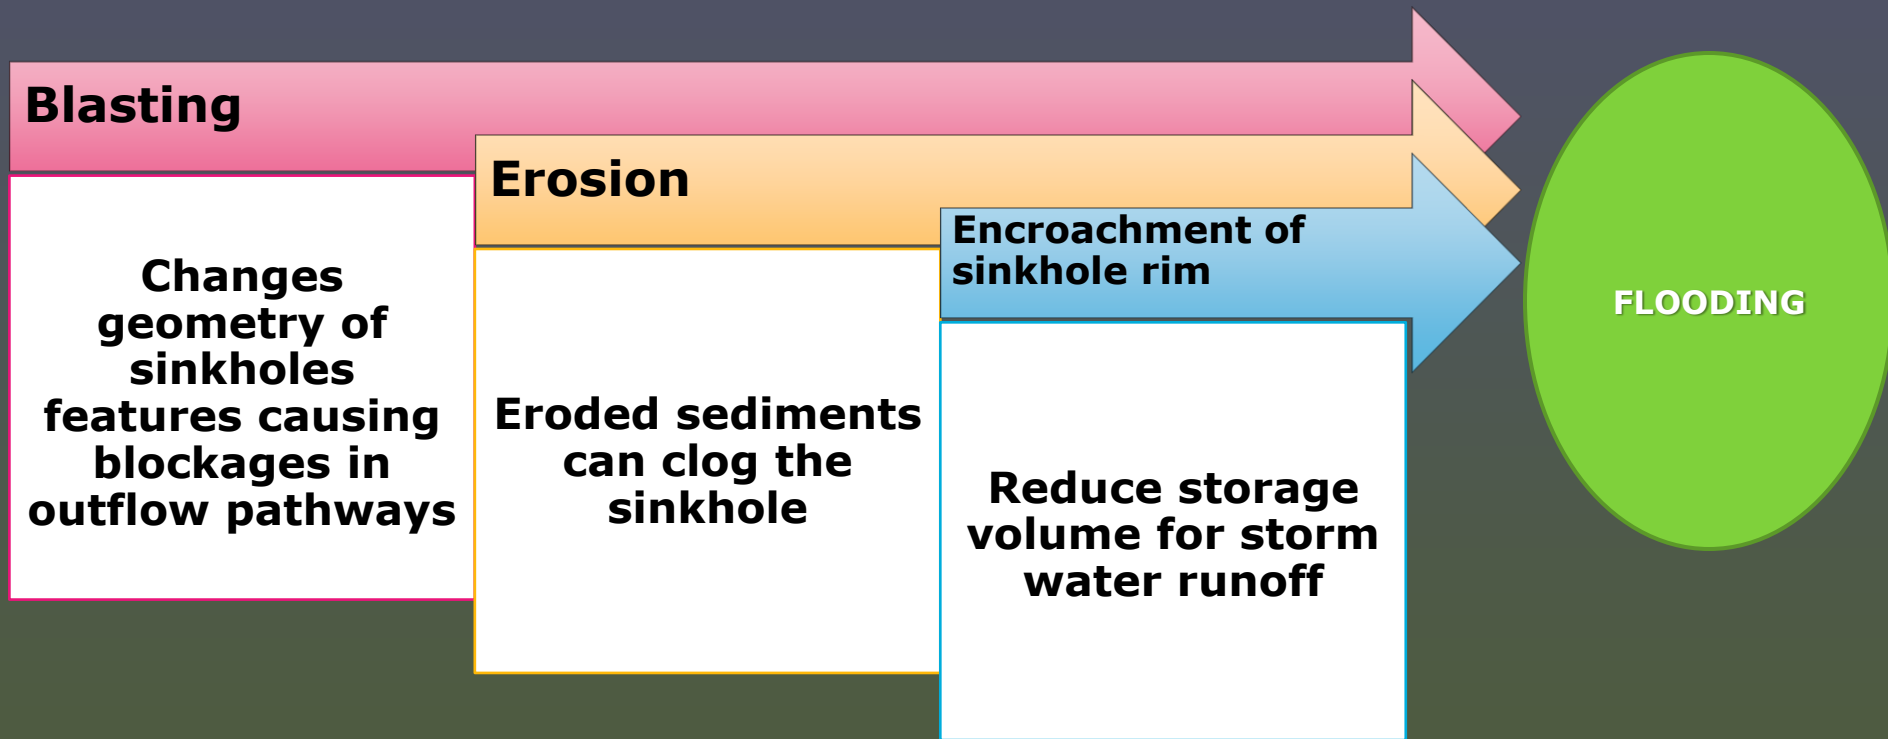

- Will be elevated during construction hours

Potential Impacts:

Slopes

- Clearance of vegetation on steep slopes
- Grading/cutting and filling of slopes

Potential Impacts: Drainage and Hydrology

Water Quality

Run off from site activities and stockpiles

Waste waters from washing of vehicles

Wastewater from construction site sanitary facilities

Improper and inadequate sewage disposal facilities

Fuel and chemical storage

Potential Impacts:

Natural hazards

- Tropical storm or hurricane force winds
- Flooding due to increased surface runoff post-development
- Earthquakes

Hazardous materials

- From improper storage of chemicals

Worker health and safety

- Construction activities

Potential Impacts: Ecology

**Inevitable
removal of
~ 150 Ha of
vegetation**

**Loss of
habitats**

**Fragmentation
of habitats**

**Impact on
faunal
species
e.g. loss
of bird
nesting
sites**

Socio-economic Impacts:

Employment

- Local construction work force

Traffic

- Heavy vehicles entering and leaving the property

Solid Waste

- construction debris, vegetation, and solid waste from the construction camp/site

Carrying Capacity

Water supply

- NWC able to supply projected 595 m³/day of water without affecting the overall water supply

Solid waste

- Facilities already overwhelmed

Health care

- Facilities already severely overwhelmed

Mitigation Measures: Air Quality

Phased vegetation clearance

- To create buffers to filter out dust
- Minimize chances of erosion

Wetting exposed surfaces

- Especially during dry periods during construction

Safety gears

- Construction crews should be provided with appropriate gears for protection

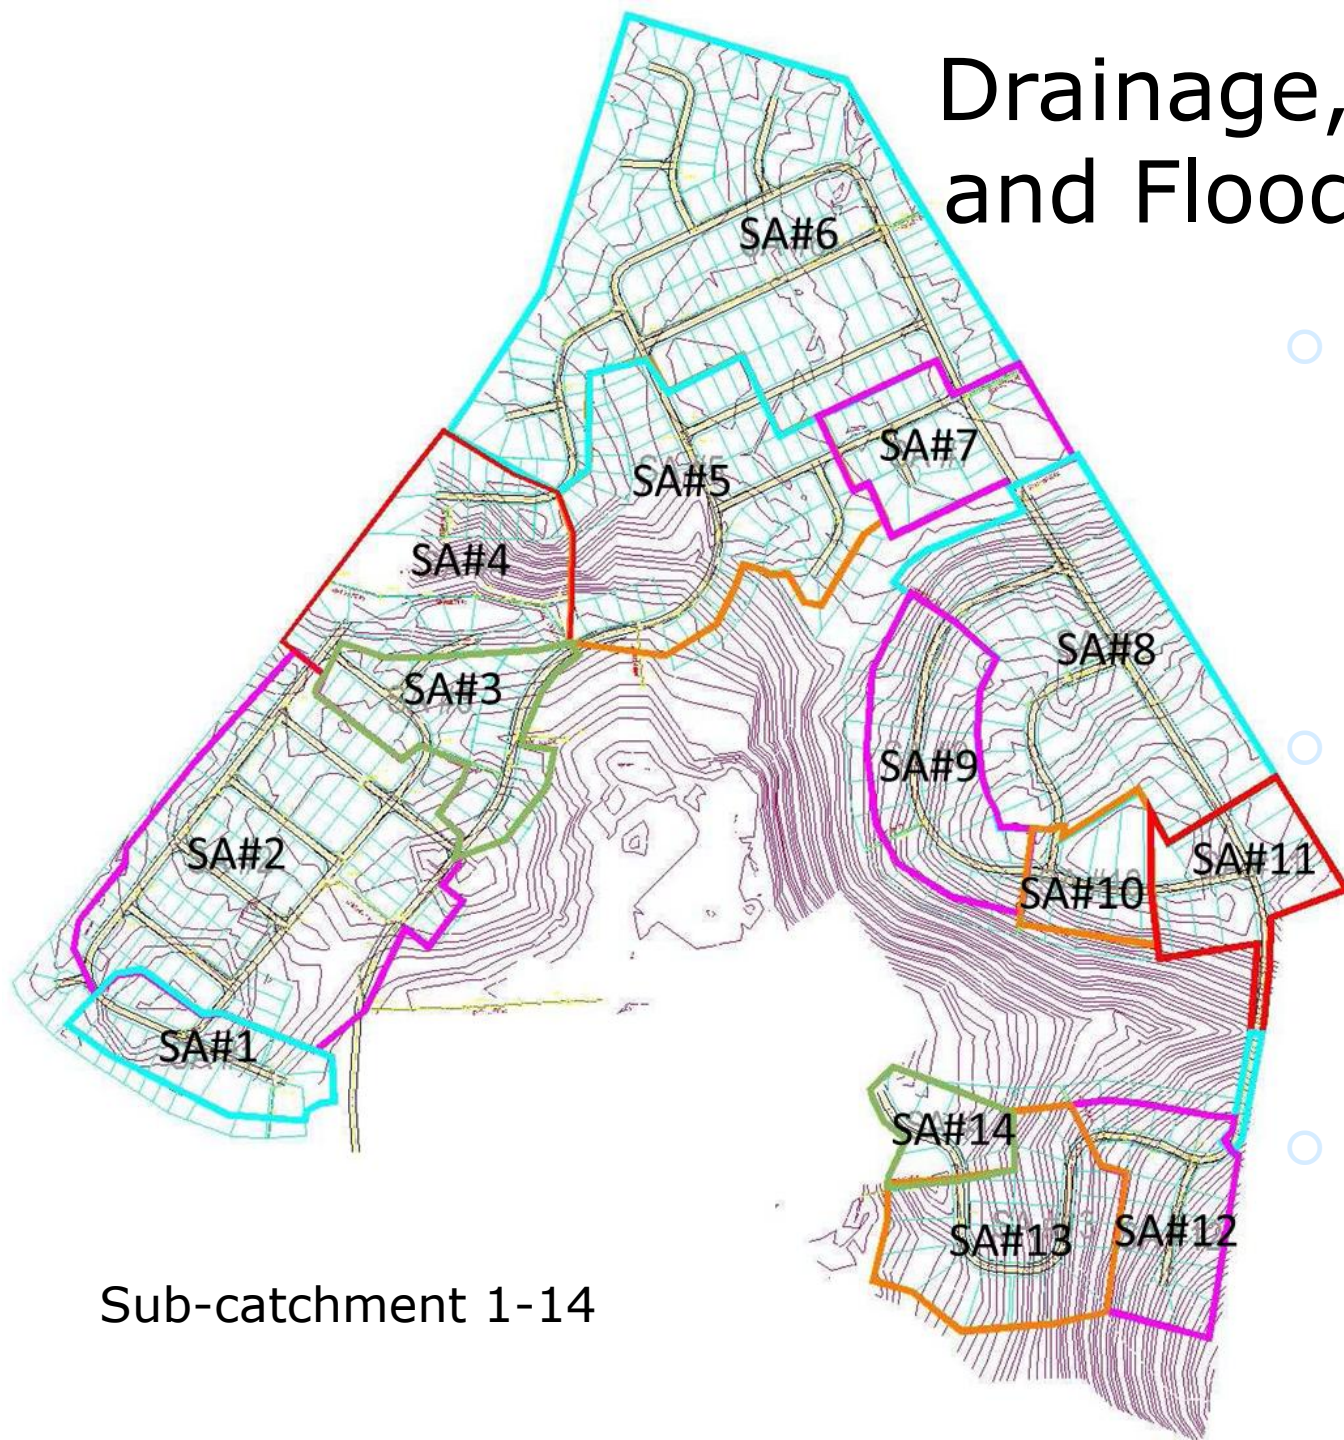

Mitigation Measures: Slopes

**No removal of
vegetation on
escarpments**

**Roads and parking
areas designed to
minimize excessive
erosion**

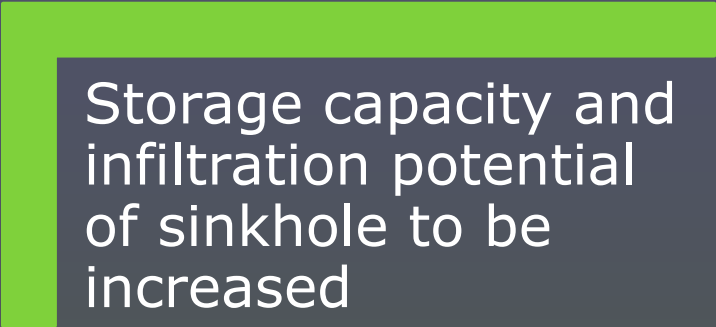

**Fills to be properly
stabilized and cuts
supported by
retaining walls or
other appropriate
structures**

Drainage, Hydrology and Flood Mitigation

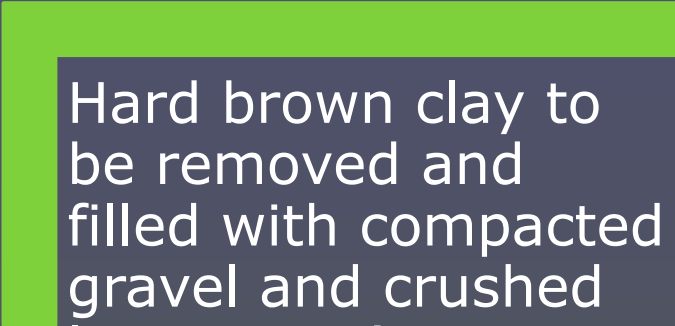

- SA#1 to SA# 5 (54.3 ha) flows to the pond in a series of storm sewer and covered U drains
- SA#6 to SA# 8 (flow north from site) have three exit points to meet natural channels in wide open U drains
- SA#9 to SA# 14 (50.5 ha) flow into the existing channels via several drains

Drainage, Hydrology and Flood Mitigation

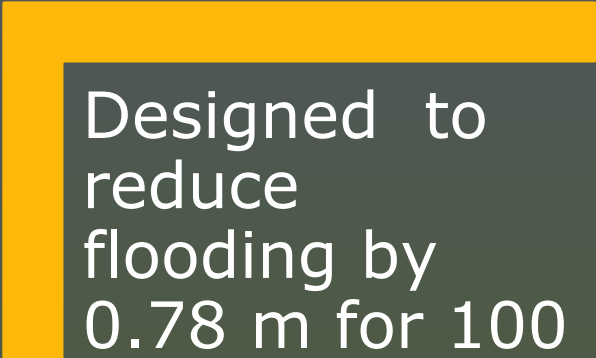

Storage capacity and infiltration potential of sinkhole to be increased

Hard brown clay to be removed and filled with compacted gravel and crushed limestone (13.5 m - 14.2 m contour)

Post development flood elevation will not exceed pre development flood elevation

Designed to reduce flooding by 0.78 m for 100 year storm

Sinkhole Protection: No-Fill Zone

No construction, vegetation removal/modification, stockpiling or storage of any kind should be allowed in this (14 m contour line)

Water Quality: Sewage Treatment

Septic tank on each lot

Lift Stations

Four "Reed Beds" (Constructed Wetland)

Three Chlorination Chambers

Reed Bed Cross Section

Example of Reed Beds – GDL Florence Hall Development

SEWAGE
REED BED
#1A

Ecology

Green space allocation

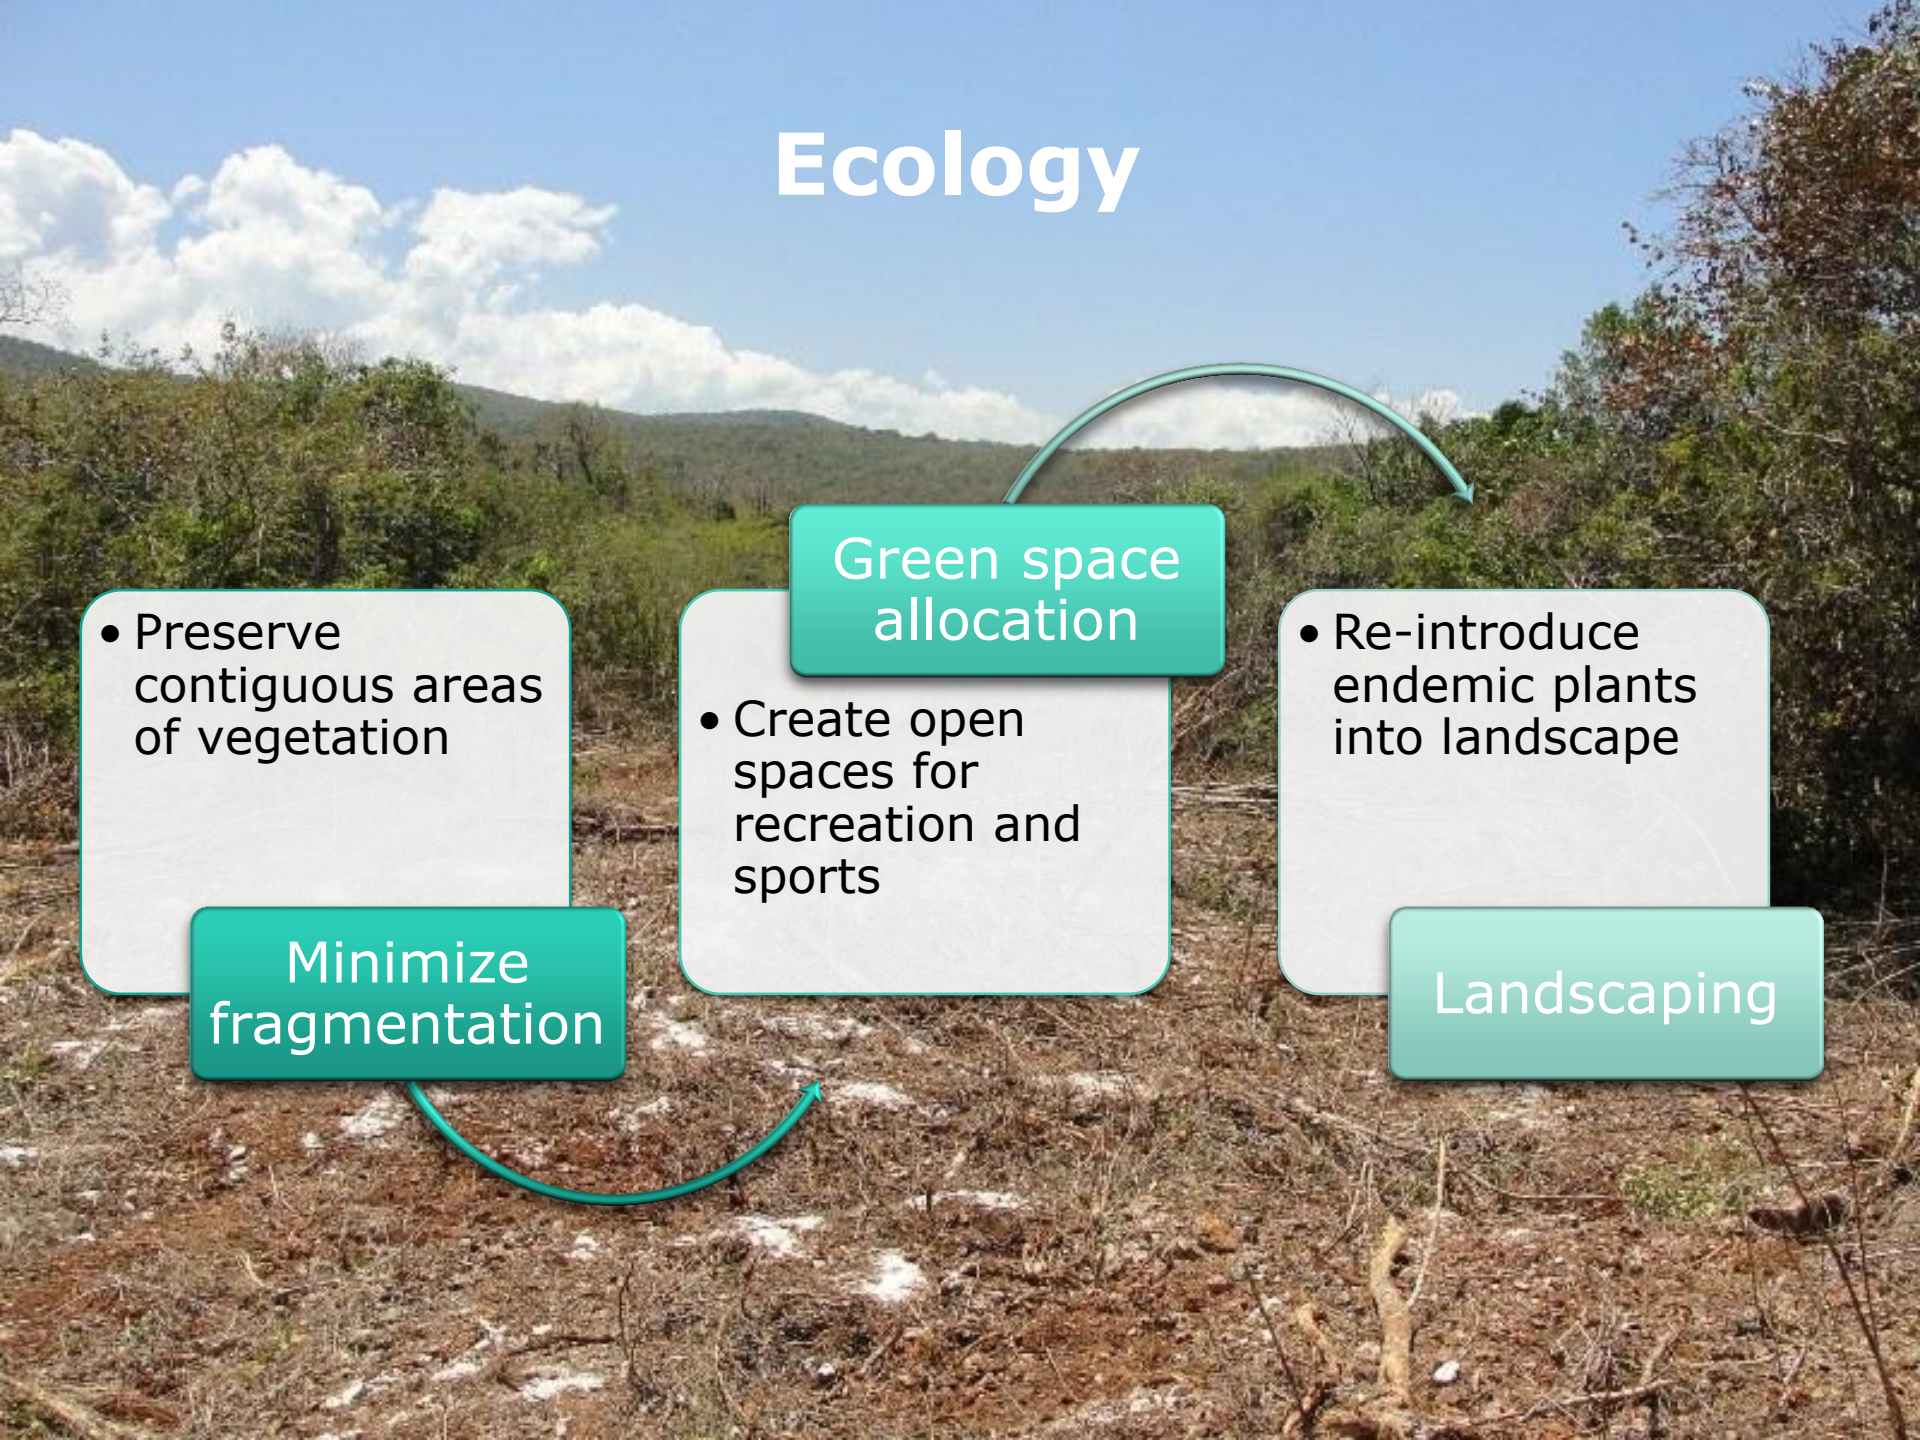

- Preserve contiguous areas of vegetation

- Create open spaces for recreation and sports

- Re-introduce endemic plants into landscape

Minimize fragmentation

Landscaping

Waste Management

Heritage

Features such as the packed stone walls should be preserved and integrated into the development

During site clearance JNHT should be present to ensure that any sub-surface structures encountered are preserved

Restoration of the Florence Hall Great House

October 2007

Colonial era

August 2012

Cumulative Impacts

Increased urbanization of the Coral Springs area due to the housing development and open commercial area

Increase in noise and dust during construction

Increased traffic during construction and increased ingress/egress to highway during operation

Improved housing stock – local residents and overseas investment (Diaspora)

Increased use of drainage basin and sinkhole could minimize future development options

Ecology – loss of natural habitat and impact on existing aesthetics

ALTERNATIVES

Sewage Treatment

- The developer may consider allowing existing Coral Springs residents to connect to the central sewage system.

Private Forestry for slopes

- E.g. as a Forest Reserve) under the Forestry Division's Private Forestry Programme

No Build Alternative

- No additional houses to meet demand
- No drainage improvements

A young child with a joyful expression is sitting cross-legged in a field of tall, dry grass. The child is wearing a green t-shirt with a colorful graphic and green sneakers. In the background, there are several small, single-story buildings with red roofs, and a wooden playground structure is visible on the right. The sky is overcast with grey clouds.

THANK YOU!

QUESTIONS AND ANSWERS
